Understand nodes, cases and coding

You code your sources to gather material about a topic and store it in a container called a node. As you explore your sources, you select content and code it at a node.

When you open either type of node, you can see all the references in one place—allowing you to reflect on the data, develop your ideas, compare attitudes and discover patterns.

Nodes

Nodes represent themes, topics, concepts, ideas, opinions or experiences. For example, you could code all references to *water quality* at the node:
